

Secure your ATV without taxing your suspension

Mac's ATV Wheel Net Pack is the ideal way to transport your ATV. By eliminating the suspension preloading required by conventional tie down straps. With Mac's ATV Wheel Nets, you secure your ATV by the tires, allowing the ATV's suspension to remain active and the tie downs to remain tight for the entire trip.

Advantages of a Wheel Net system

With conventional tie down straps, you attach to the chassis and draw down to generate sufficient compression in the shocks to hold the vehicle in place. This constant load on the suspension, coupled with loads experienced during transport, can elevate the risk of blowing a shock seal. And a change in compression could lead to slack, which can increase the load spikes, unduly stressing the strap material.

Mac's ATV Wheel Nets avoid these complications by locking the tires in place. By affixing the tires, the ATV's suspension is allowed to operate as designed, absorbing the shocks of the road. And isolated from the chassis movement, the wheel nets maintain their tension as well at the end of the road as when you started.

Designed to Fit Most ATV Tires

Mac's ATV Wheel Net Pack includes (2) small and (2) large wheel nets:

- The small wheel nets are designed for the most common front tire, measuring 8" x 25" x 12"
- The large wheel nets are designed for the most common ATV rear tires, measuring 10" x 25" x 12"

Tire Measurements (in inches)

ATV tires are measured by **Height (H) x Width (W) x Inner Wheel Diameter (ID)**, as shown in the above diagram.

Strong and Dependable

Each Mac's ATV Wheel Net is designed to a 2,800 Minimum Breaking Strength (MBS), giving you plenty of safety margin for even the heaviest ATV. Mac's uses the highest quality strap material available, significantly improving chafing and UV resistance over "standard" straps. We then fabricate our wheel net with the highest stitch count in the industry.

Smooth Ratcheting

Mac's ratchets are well known for how easily they operate, every time. Our unique design resists the binding that can occur on other ratchets from dirt or racking.

Made in the USA

We carefully sew and assemble each tie down strap in our Sandpoint Idaho shop, allowing us to retain a level of quality that is often lost when manufacturing is outsourced. Plus, we feel good about creating American jobs!

Convenient Storage

When you've arrived, store your wheel nets in the included Mac's Small Tool Bag. The tough woven body of this bag will handle the bumps and bruises, while the integral handles are made of black webbing that wraps around the entire back for better weight support. It's the perfect size to pack your wheel nets and toss behind the seat of your truck or in your car's trunk.

Choose your Attachment Style

Flat Snap Hook Attachment Style

The Flat Snap Hook system consists of captive hooks at each end. The advantage of these standard hook ends is that they can be used with most anchor points (e.g., D Rings) or track system (e.g., VersaTie, E Track, etc), provided the hard points and fittings support the load requirement. This is a good choice if you already have standard tie down points on your deck, especially if your hardpoints are on the perimeter of the trailer.

Versa Tie™ Anchor Attachment Style

The Versa Tie Anchor option is a good choice due to the ease of installation. The included deck hardware installs on the surface of the deck, using the two included stainless steel screws and zinc-coated backing plate. The Mac's ATV Wheel Net ends are terminated with an integrated Single Stud Tie Down Ring, which easily snaps into the Versa Tie Anchor.

For even more versatility, you can use this attachment style with any of our Versa Tie track or track kits.
