

ForkTru - Fork Alignment Tool

Motion Pro has developed a simple but ingenious way to align the forks on off-road and MX motorcycles. With the ForkTRU™, you will always know your fork legs are perfectly parallel from top to bottom. Proper fork alignment reduces stiction which allows the suspension to work freely, leading to better handling and increasing the life of your fork seals and bushings.

Simple to use, all you do is set the ForkTRU™ to the width of the upper fork tubes below the triple clamp, then move it to the bottom fork tubes where you can precisely adjust your fork width to match the top. The age old method of pushing your forks up and down will only leave you guessing if they're aligned properly, but the ForkTRU™ will give you the accurate results you're looking for with no measuring needed.
